

It's a virtual weather station

WeatherTrak is an integrated system that schedules irrigation based on local weather conditions. It pulls information from 12,000 weather stations all across the U.S. and inputs the data into scheduling software on your irrigation's computer. According to WeatherTrak, "ET Everywhere" virtual-weather-station data can be pulled from within 1 sq.km. for 90% of the country.

Multi-year field studies funded by several national and regional organizations have proven that WeatherTrak can save more than 50% of outdoor water use, while reliably maintaining and improving plant health and dramatically reducing and even eliminating irrigation-based runoff that contributes to non-point-source pollution.

The company manufactures, licenses and sells the patented WeatherTrak Irrigation Management Solution, which is composed of WeatherTrak controllers for residential and commercial applications, WeatherTrak Data Service, and WeatherTrak Internet Services. WeatherTrak's multiple applications and benefits address a wide range of constituents from landscape professionals, to water purveyors, to home and business-owners.
