

SOFTWARE RELEASE:

CB_040609

**WeatherTRAK ET Pro² Central Series
Web Software Update v5.4.3**

04/06/09

Products:	ET Pro ² Central Series – 12, 18, 24, 30, 36, 42 & 48 stations
Versions:	Controller software 5.0.2 and higher

Summary

We are pleased to announce upgraded software for www.weathertrak.net customers using ET Pro² Central Series controllers.

Description

v5.4.3 software is exclusively web application software and reflects the following enhancements:

- Performance – Page opening and refresh rates for the CONTROLLER LIST and PROGRAM pages have improved by approximately 30%. Performance enhancements will vary depending on your computer hardware and type of internet connection.
- Viewing two separate windows (controllers) at the same time – Improvements have been made allowing a user to open two windows to view two controllers at the same time for comparative purposes.
- Saving Changes – other changes that will be readily observed is when you save or send a rain pause or save data on the CONTROLLER LIST, MANAGE or PROGRAM pages.

Each of these is described in more detail below.

- CONTROLLER LIST page – sending a rain pause. The following dialog box will appear when a rain pause is sent for a single or multiple controllers within an account

Automated rain pause messages received **after** a rain pause has been entered on the www.weathertrak.net web application may be over-ridden. To prevent this occurrence, please call WeatherTRAK Customer Service and ask to have one or more controllers excluded from automated rain pause sending.

- MANAGE page - when saving and changes such as, station mode, % Adjust or Target MAD adjustments, a new dialog box will appear confirming this action.

Any user-defined changes are commonly held in a queue for approximately 10 minutes before being sent down to the controller. To ensure changes are sent to the controller immediately, press the "Update Schedule" button then press the F5 key after 3-4 minutes

to allow the web page to refresh to confirm your changes have been received.

- PROGRAM page - When saving change made in any section, a new dialog box will appear after the "Save" button is selected to confirm this action.

Again to ensure changes are received immediately, press the "Update Schedule" button on the MANAGE page then press the F5 key after 3-4 minutes to allow the web page to refresh.

FAQ's

The following FAQ's have been developed to help understand controller behavior specific to rain pause as follows:

1. *I entered a 5-day rain pause to several controllers in my account on www.weathertrak.net. I reviewed the remaining days the following day and only 2 remaining days were displayed.*

An automated rain pause message was received after your rain pause message was sent, thereby over-riding your original message. If you don't want your rain pause durations over-ridden, call WeatherTRAK Customer Service and request to have all or some controllers excluded from automated rain pause.

2. *What do I need to do to prepare for this new software update?*

Nothing, WeatherTRAK Central Internet Management software resides on our server and the application layer has been updated to improve page performance and the user experience.

3. *Will this update impact any previously stored controller logs or reports?*

No, any previously stored controller data will remain intact and unaffected by this software update.

Need Help?

If you have additional questions, please call WeatherTRAK Customer Service toll-free, (800) 362-8774.
